

CASE STUDY

The Company:

RainWave is, a US company offering precipitation monitoring systems. The RainWave solution enables farmers across the U.S. to set up virtual rain gauges by entering GPS coordinates

The Challenge:

RainWave was looking for assistance with selecting a hosting provider.

The Solution:

We chose WebSan as our Dynamics GP hosting provide .While working with WebSan, they proved to be incredibly responsive experts in their field. We recently sold our company and WebSan played a critical role in the due diligence process and sale. We never had to make a large investment in software and when the sale was complete, they simply provided us a copy of our database. WebSan is a great company to work with for Dynamics GP hosting services, and I would recommend them to anyone in the U.S. or Canada

“

"While working with WebSan, they proved to be incredibly responsive experts in their field. They were always easy to reach when we needed them. We never had any downtime and access to our Dynamics GP environment was simple and straightforward from anywhere, anytime. This proved to be a huge asset.
